Site Opportunity Report

47brand.com | 15 September – 14 October 2026, with 1–14 September for context | Prepared 15 October 2026

We re-analysed 63,170 orders worth $4,000,227.39, 2,528,736 human visits, and the full click, scroll and recovery record, including the pipeline datasets for the analysed page, Fall Collection (`/collections/fall-collection`).

Contents

The biggest wins · At a glance · The month in numbers · Opportunity 1 — Bring back the carts, then fix browse abandonment · Opportunity 2 — Close the gap between mobile cart and checkout · Opportunity 3 — Lift the $48 median basket toward the $110 line · Opportunity 4 — Make every Meta dollar accountable · Opportunity 5 — Stop paying to land shoppers on Fall Collection · Opportunity 6 — Open the dead ends: search and low-converting pages · Opportunity 7 — Turn one-time buyers into a replenishment habit · Opportunity 8 — Clean the traffic and order record before scaling spend · Worth watching · What’s working · Suggested next 30 days · Method and caveats

The biggest wins

Six moves cover most of the opportunity in this window: two fix where paid traffic lands, one raises the value of every order, two recover demand that already exists, and one turns this month’s first-time buyers into next month’s revenue.

1. **Pause the team-specific postseason Meta creatives and re-point that spend.** The five MLB postseason creatives named for the Dodgers, Yankees, Brewers, White Sox and Guardians produced 42 orders from 57,305 visits — $0.04 of on-site revenue per visit against a site average of $1.43. Move that budget to the proven broad carousels, which convert at 1.5–1.8%. (Opportunity 4)
2. **Fix the mobile cart before spending another dollar on traffic.** Mobile adds to cart at 9.2% but only half of those carts reach checkout (49.8%), against 75.6% on desktop. Half that gap is worth up to about $740,000 a month. (Opportunity 2)
3. **Stop sending paid social to Fall Collection.** The page took 236,635 visits in the window and converted 0.17% of them; 89% of social entries leave without a second pageview. Re-point those ads to collections that buy, like Sale (6.25% buyer rate) and Men’s Franchise (5.26%). (Opportunity 5)
4. **Lift the median basket.** Half of all orders are under $48.29, and only 9.5% of orders clear the $110 high-value line — yet those hold 24.3% of revenue. Bundles that pair a cap with a tee move the median, not the discount. (Opportunity 3)
5. **Rebuild recovery for the phone.** Abandoned-cart chains already return $897,461 a month at an 11.7% purchase rate, but mobile chains buy back at 5.7% against 7.7% on desktop. Closing that gap is worth on the order of $200,000 a month. (Opportunity 1)

6. **Switch on a replenishment flow for the 39,768 first-buyer devices.** Returning devices already drive 28.6% of matched orders and $1,029,660 of window revenue; a post-purchase flow at a conservative 5% response is worth up to about $125,000 a month. (Opportunity 7)

Supporting plays that did not make the six: open up site search, where 73.7% of visits end on the results page (Opportunity 6); and reconcile the tracking record — 11.8% of orders matched no visit and 42.5% of raw traffic is dead sessions (Opportunity 8).

At a glance

#	Finding	Recommended action	Priority
1	Meta paid delivers $0.72 per visit against $1.43 site-wide; five postseason creatives deliver $0.04	Pause the five team creatives; re-point budget to broad carousels	High
2	Mobile cart reaches checkout 49.8% of the time vs 75.6% on desktop	Fix the mobile cart drawer: persistent cart, early shipping cost, express checkout	High
3	Cart recovery buys back 5.7% of mobile chains vs 7.7% desktop	Refresh the mobile recovery email/SMS sequence	High
4	Fall Collection converts 0.17% of 236,635 visits; 89% of social entries are single-page	Re-point paid social to converting collections	High
5	Browse-abandonment chains buy at 4.2% vs 11.7% for cart chains	Add a browse-abandonment flow built like the cart flow	Medium
6	Median order $48.29, below the pre-period $50.00; 9.5% of orders are $110+	Test cap-plus-tee bundles and a shipping threshold once confirmed	Medium
7	73.7% of 253,203 search visits end on the results page	Fix zero-result and low-click searches	Medium
8	39,768 window orders came from devices with no prior purchase	Build a replenishment/post-purchase flow	Medium

#	Finding	Recommended action	Priority
9	Desktop completes checkout-to-order at 21.3% vs 48.3% on mobile	Verify desktop checkout instrumentation before acting	Watch
10	42.5% of raw visits are dead sessions; 7,445 orders match no visit	Bot/consent audit and order-match reconciliation	Watch

Table 1 — The ten headline lines of the window, with the numbers as of 14 October 2026. Sizes are monthly estimates from current volumes, not forecasts.

The month in numbers

Definition	Value
Report window	15 September – 14 October 2026 (30 days)
Orders	63,170
Revenue	$4,000,227.39
Average order / median order	$63.32 / $48.29
Human visits (dead sessions removed)	2,528,736 (84,291 per day)
Dead sessions removed	1,868,538 (42.5% of 4,397,274 raw visits)
Conversion (buyer visits / visits)	2.19%
Add-to-cart rate	9.57% of visits
Returning share of visits	23.6%
High-value line	$110 (90th percentile of order revenue)
Orders at or above $110	6,020 (9.5% of orders, 24.3% of revenue)
Peak days	19 September, 20 September, 4 October

Table 2 — Window definitions. Orders and revenue are from the order file; visit rates use human visits only.

Weekly orders, Monday weeks, from the order file:

Week	Orders	Revenue
14 Sep (from 15th)	13,685	$872,840
21 Sep	12,867	$831,168

Week	Orders	Revenue
28 Sep	16,785	$1,072,050
5 Oct	14,296	$882,804
12 Oct (through 14th)	5,537	$341,365

Table 3 — Weekly orders and revenue. The first and last weeks are partial; the 28 Sep week contains the 4 October peak.

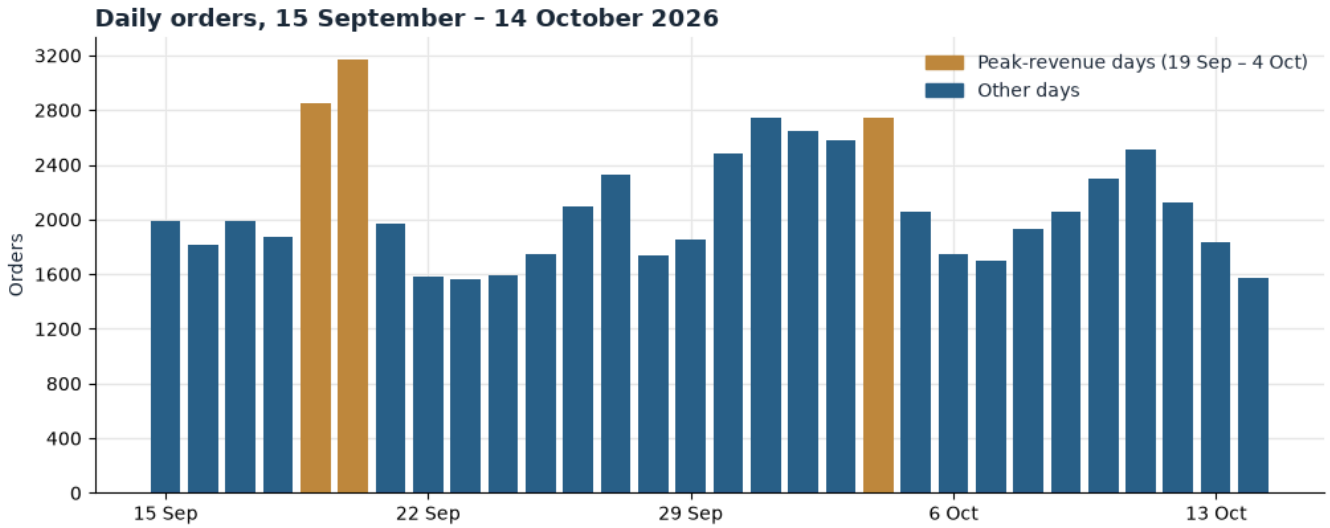

Figure 1. Daily orders, 15 September – 14 October 2026, with pre-window context from 1 September. Gold days are the three peak-revenue days — 19 September, 20 September and 4 October — which together held 8,768 orders and $553,948, 13.8% of window revenue. Grey days are the prior fortnight.

Two contexts matter for reading the month. First, volume against the prior fortnight: orders ran 2,106 a day against 2,195 in the pre-period, and revenue ran $133,341 a day against $141,775 — a softer September that accelerated inside the window, from 30,142 orders in the first half to 33,028 in the second. Visits were flat at roughly 84,000 a day, so the softness is conversion and add-to-cart, not traffic. Second, where demand concentrates: the three peak days lift every channel at once — search, direct and paid social together — with a marked-down share of 1.5% against 3.5% for the window. That is game-calendar demand, not a code. The campaign file itself names the moment: NFL season launches and new evergreen sends around 20 September, and MLB Wild Card and Division Series sends around 4 October. Peaks like these are earned by the sports calendar; the rest of the month is what the site controls.

Opportunity 1 — Bring back the carts, then fix browse abandonment

What we saw. We followed every recovery chain triggered between 15 and 30 September for the full 14 days each chain is observed.

Trigger	Chains	Returned	Purchased	Purchase rate	Recovered revenue
Abandoned cart	97,873	52,272	11,466	11.7%	$897,461
Showed interest (browse)	336,438	147,466	14,038	4.2%	$1,127,698
Super shopper	140,303	88,973	9,244	6.6%	$717,911

Table 4 — Trigger chains with a closed 14-day follow-up window, 15–30 September cohort. Recovered revenue is revenue attributed to the chain.

By device, the purchase rate on those same chains is 5.7% on mobile, 7.5% on tablet and 7.7% on desktop — and mobile carries 82% of all chains.

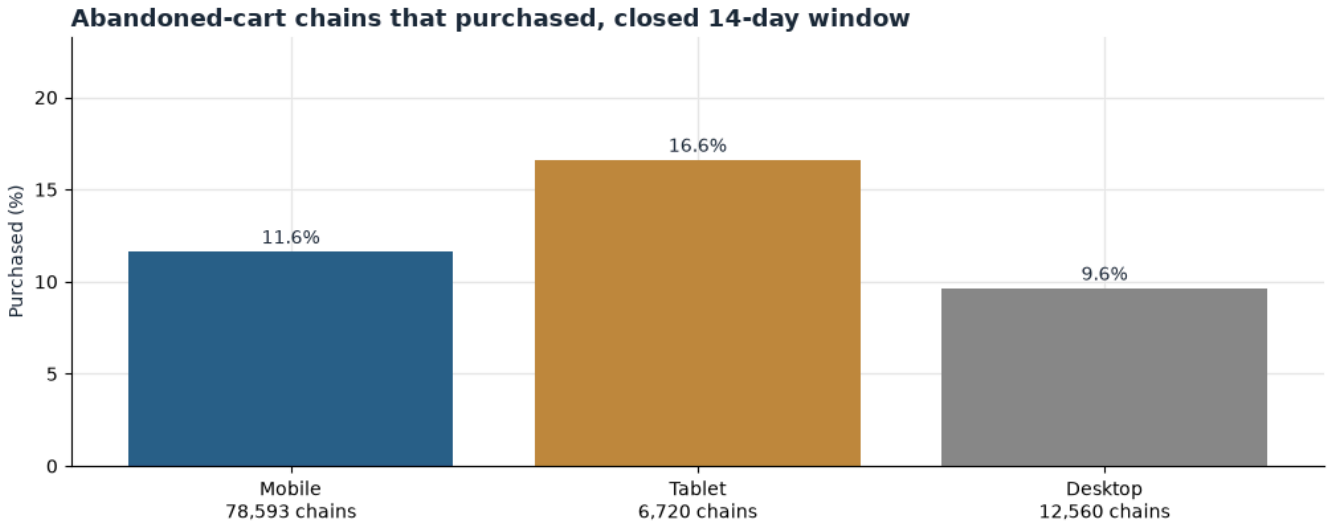

Figure 2. Abandoned-cart and browse chains that purchased within the closed 14-day window, by device. Mobile holds 470,712 of 574,614 chains but buys back at 5.7% against 7.7% on desktop.

- The cart programme works: one chain in eight returns to buy, and it is already returning close to $0.9 million a month.
- The phone is where the programme underperforms: four chains in five are mobile, and mobile buys back two points below desktop.
- Browse abandonment is the bigger, weaker file: 3.4 times the cart volume buying at a third of the rate.

Why it matters. Every purchase-rate point on the cart file is roughly 980 orders, about $62,000 a month. Closing the mobile recovery gap alone is worth up to about $200,000 a month, assuming mobile chains respond to the same treatment desktop already gets and buy at the window average order of $63.32. The structural reason the gap persists: the recovery journey ends back on a mobile cart that itself leaks (Opportunity 2), so the two fixes compound.

Recommended actions.

- Rewrite the mobile recovery sequence as a three-touch SMS-first flow with the abandoned product and a one-tap cart link; keep email as the second touch.
- Put the order total and the shipping cost in the first message so the return visit has no surprise at checkout.
- Deep-link recovered sessions to a pre-filled express checkout (Shop Pay / wallet), not to the cart page.
- Build the browse-abandonment flow on the cart flow's template: same cadence, product shown, no incentive until the third touch.
- Track: mobile chain purchase rate, now 5.7%; target 7.5%, the tablet rate, within 30 days.

Opportunity 2 — Close the gap between mobile cart and checkout

What we saw. The funnel by device for the window:

Device	Visits	Add-to-cart	Cart→checkout	Conversion	Revenue per visit
Mobile	2,100,537	9.2%	49.8%	2.19%	$1.39
Desktop	270,620	12.3%	75.6%	1.96%	$1.48
Tablet	157,579	10.0%	53.5%	2.49%	$1.74

Table 5 — Device funnel, human visits, 15 September – 14 October 2026. Conversion is buyer visits per visit; revenue per visit is on-site value.

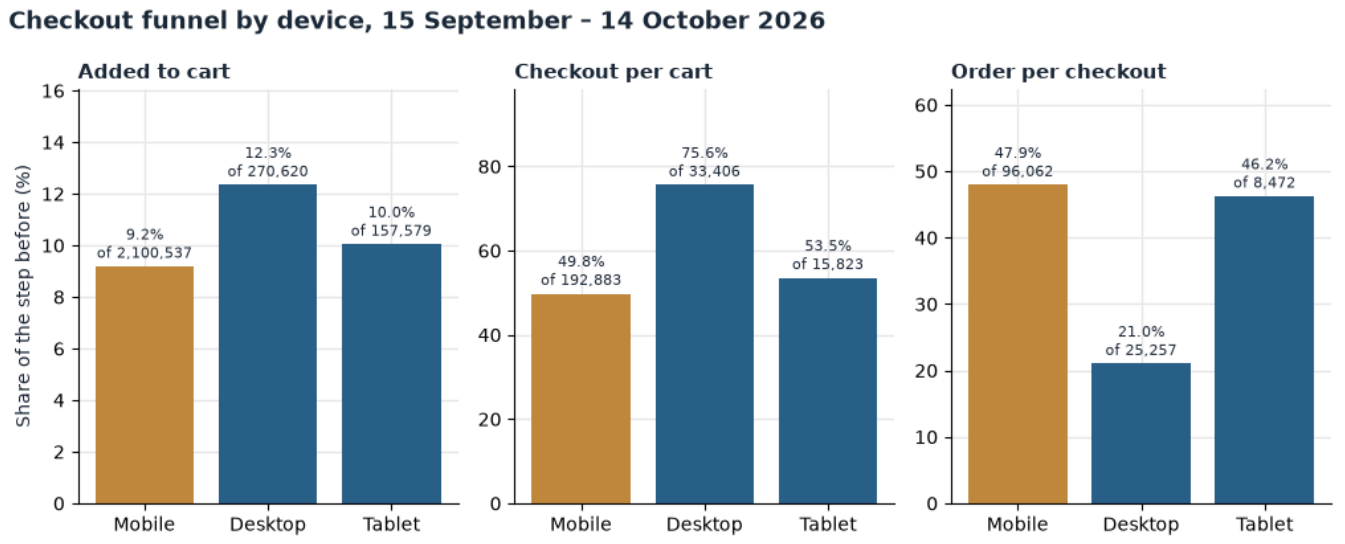

Figure 3. The checkout funnel by device: visits, add-to-cart, checkout and order, 15 September – 14 October 2026. The break sits between cart and checkout on mobile — 49.8% against 75.6% on desktop — while mobile completes checkout-to-order at 48.3%, better than desktop's 21.3%.

- The break sits between cart and checkout: mobile adds to cart at 9.2%, desktop at 12.3%, but only half of mobile carts reach checkout against three-quarters of desktop carts.

- Past the break, mobile is fine: 48.3% of mobile checkout sessions end in an order, better than desktop.
- Mobile is the business: 83% of visits and 84% of orders, at a $61.81 average order.

Why it matters. These are ready buyers fidgeting at the moment of commitment — the cart holds, the checkout never starts. If mobile carts reached checkout at the desktop rate, the extra checkouts would convert at today's mobile checkout-to-order rate of 48.3% and the mobile average order of $61.81; even half the gap is worth up to about $740,000 a month. That assumes no change in checkout behaviour, which is why it is an upper bound.

Recommended actions.

- Show the shipping cost and delivery date inside the cart drawer, before checkout, on mobile.
- Make the cart persistent across sessions on mobile; a bag rebuilt from memory reads as lost.
- Put express checkout (Shop Pay, Apple Pay, Google Pay) at the top of the drawer, above the cart line items.
- Cut the drawer to one screen: line items, total, delivery promise, one checkout button.
- Track: mobile cart→checkout, now 49.8%; target 60% in four weeks.

Opportunity 3 — Lift the $48 median basket toward the $110 line

What we saw. The window order-value profile:

Measure	Value
Median order / average order	$48.29 / $63.32
Pre-period median / average	$50.00 / $64.58
75th percentile	$77.75
90th percentile (high-value line)	$110
Orders at or above $110	6,020 — 9.5% of orders, 24.3% of revenue
Orders above the median, below $110	26,410
Multi-item orders (paid_to_item ≥ 1.9)	19.3%

Table 6 — Order-value distribution from the order file, 15 September – 14 October 2026.

- Half of all orders sit under $48.29, and the median slipped $1.71 from the pre-period while volume held — the month traded a little value, not demand.
- High-value buyers over-index on team scrum tees and blank basics: the Blank Scrum Tee pages reach high-value devices at 38–48 times the rate of all visitors.
- Meta creative copy advertises free shipping ("Free '47 Family Shipping", read from creative names on 15 October); the bundle records no minimum spend, so no threshold line is drawn here.

Why it matters. The 26,410 orders between the median and the $110 line are one add-on away from the high-value tier that already carries a quarter of revenue. Moving the median order from $48.29 to $55 is worth up to about $420,000 a month at current order volume, assuming the gain comes from basket additions, not discounting. The structural reason it persists: the path from one cap to two items is merchandised nowhere — no bundle, no threshold, no "completes the look" module on the pages high-value buyers actually visit.

Recommended actions.

- Merchandise a cap-plus-tee bundle at $75–$95 on the top team pages and on Fall Collection rows one and two.
- Add a "complete the look" module to the five scrum-tee pages where high-value devices over-index most.
- Confirm the live free-shipping threshold on the storefront and record it; only then test a threshold nudge.
- Track: median order, now $48.29; multi-item share, now 19.3%.

Opportunity 4 — Make every Meta dollar accountable

What we saw. Channel value per human visit, last touch:

Channel	Visits	Conversion	Revenue per visit
Search	638,950	3.26%	$2.23
Direct	487,647	2.29%	$1.63
Meta paid	968,607	1.27%	$0.72
Email/SMS	253,175	1.88%	$1.16
Meta untagged (organic social)	104,966	3.63%	$2.19
Site average	2,528,736	2.19%	$1.43

Table 7 — Referrer channels, human visits, 15 September – 14 October 2026. Meta paid is 38% of human visits.

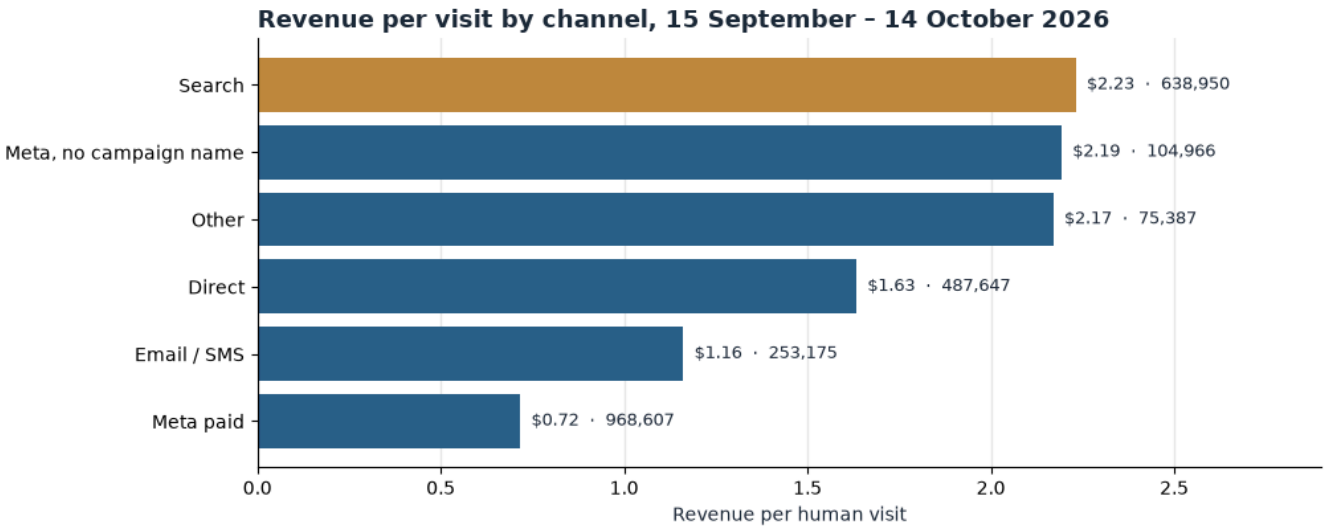

Figure 4. Revenue per human visit by referrer channel, 15 September – 14 October 2026. Meta paid delivers $0.72 against $2.23 for search and $2.19 for untagged organic social.

Inside the paid channel, by creative:

Creative	Visits	Orders	Conversion	Revenue per visit
ASRT All Leagues, All Teams — Carousel 1 (Free Shipping)	152,164	2,796	1.82%	$1.02
ASRT All (Licensed + Classics) — '47 Family copy	81,007	1,587	1.93%	$1.00
HW NCAA & NFL headwear DPA Carousel 2	37,939	923	2.40%	$1.44
DPA numeric-ID creatives (three largest)	60,083	418	0.70%	$0.23
MLB postseason team creatives (five named teams)	57,305	42	0.07%	$0.04
link_in_bio	10,798	290	2.68%	$1.74

Table 8 — Meta creatives with volume, 15 September – 14 October 2026. The five named-team postseason creatives are the Dodgers (two), Yankees, Brewers, White Sox and Guardians.

- Meta paid takes the most traffic of any channel and returns the least value per visit — half the site average, a third of search.
- The worst spend is specific and nameable: team-postseason creatives at $0.04 a visit, and numeric-ID DPA creatives at $0.23.
- Untagged organic social, the same audiences arriving without a paid link, converts at 3.63% — the audiences are fine; the buys are not.

Why it matters. Last touch credits the visit to the link it arrived on; ad spend is not in this bundle, so this is on-site value, and the profit check belongs in Ads Manager. On-site, re-pointing the 57,305 visits the five team creatives bought at the site average of $1.43 is worth up to about $80,000 a month. The structural reason: broad creative outperforms named-team creative by 25 to one, yet the named teams kept spend all month.

Recommended actions.

- Pause the five named-team postseason creatives today; do not rebuild them until a team actually advances.
- Re-point that budget to the broad All Leagues carousels and the NCAA & NFL headwear DPA, the strongest paid line at $1.44 a visit.
- Name every creative in words in utm_content; the numeric-ID rows are unauditable as shipped.
- Pull spend beside revenue per visit in Ads Manager weekly; keep any creative under $0.75 a visit on probation.
- Track: Meta paid revenue per visit, now $0.72; target $1.00 in 30 days.

Opportunity 5 — Stop paying to land shoppers on Fall Collection

What we saw. Fall Collection is the analysed page and the window’s biggest traffic-taker that does not convert:

Measure	Value
Visits (first and second periods)	236,635
Buyer rate	0.17%
Entry visits / entry buyer rate	222,088 / 0.10%
Meta campaign-link entries	46,077 at 0.44% conversion, $0.33 per visit
Social entries (pipeline)	212,557 with an 89% single-pageview share
Mobile scroll: reached 20% depth	21.4% of entry sessions
Mobile scroll: reached the foot	3.5%

Table 9 — Fall Collection traffic and engagement, 15 September – 14 October 2026. Pipeline rows describe this page only.

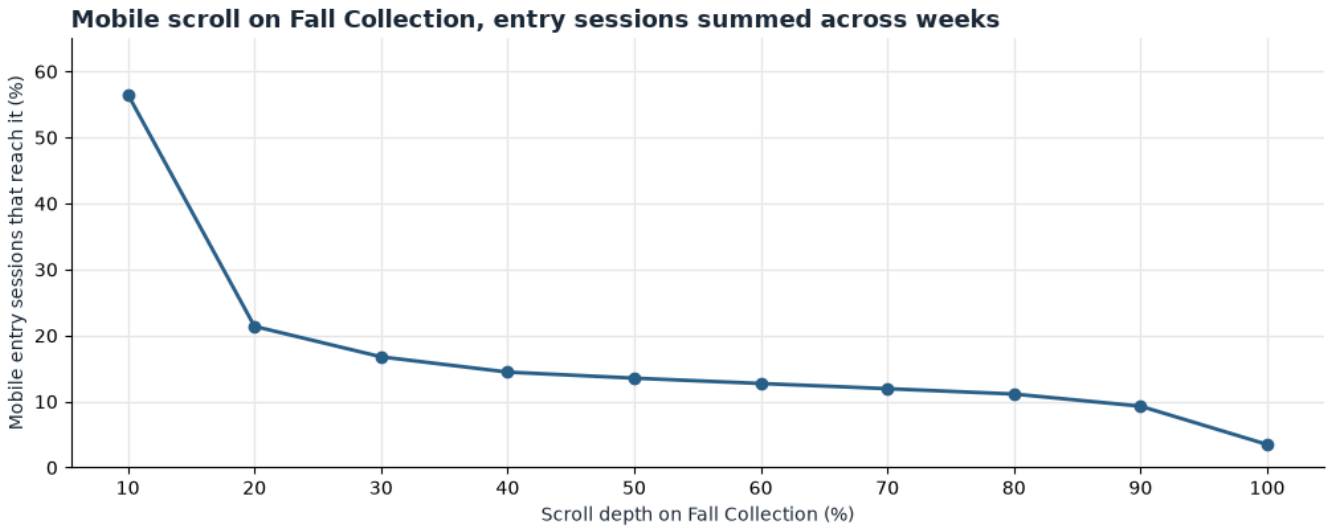

Figure 5. Mobile scroll depth on Fall Collection, entry sessions summed across weeks. Only about one session in five reaches the second screen of products; 3.5% reach the foot.

- The page is a landing page for paid social, and it ends the visit: 89% of social entries never see a second page.
- Mobile shoppers never get far enough to disagree: four in five leave before the second row of products.
- Collections that convert prove the traffic is fine: Sale (6.25% buyer rate), Men's Franchise (5.26%), Headwear (3.77%).

Why it matters. Re-pointing the 46,077 Meta visits the page absorbs at the site average of $1.43, instead of its $0.33, is worth up to about $50,000 a month on that segment alone — before counting the browse value of sessions that currently end on the first screen. It assumes re-pointed traffic converts like the destination's existing traffic.

Recommended actions.

- Point Meta product ads at the converting collections (Sale, Men's Franchise, Headwear) or at product pages, not at Fall Collection.
- If Fall Collection stays a landing page, put quick-buy and price on the first two product rows and cut the filter wall before the grid.
- Load the first screen with the current-season teams the campaign file is already pushing (NFL launches, MLB postseason).
- Track: Fall Collection entry buyer rate, now 0.10%; social single-page share on the page, now 89%.

Opportunity 6 — Open the dead ends: search and low-converting pages

What we saw. Pages that take traffic and give nothing back:

Page	Visits	Buyer rate	Single-page share
/search	253,203	5.03%	73.7%

Page	Visits	Buyer rate	Single-page share
/pages/nfl	75,108	0.54%	9.4%
/collections/mens-headwear	76,536	4.20%	76.3%
/pages/47-select	41,464	5.15%	82.1%
/collections/mlb-past-champs	44,276	0.82%	14.9%
/collections/from-the-vault	18,315	0.35%	12.1%

Table 10 — Site pages with volume, first and second periods. Buyer rate is buyer visits per visit; single-page share is visits that were also the last page.

- Search is the quiet leak: a quarter-million visits, three in four ending on the results page itself. The buyer rate of 5.03% says searchers intend to buy; the single-page share says most leave anyway.
- Content pages that should warm demand — /pages/nfl at 0.54%, From the Vault at 0.35% — take five-figure traffic and hand it nowhere.
- By contrast, collection landings with real assortment convert one to two visits in fifty; the dead pages lack a next step, not an audience.

Why it matters. If half of the single-page search visits found one more page and converted at the site rate of 2.19%, that is up to about $180,000 a month — an upper bound that assumes recovered searches behave like ordinary browsing visits. The structural reason: the results page is a cul-de-sac with no merchandising, and the content pages end without a collection link above the fold.

Recommended actions.

- Pull the zero-result and no-click search queries for the window; fix the top 50 by synonym and redirect.
- Merchandise the search results page with the current NFL and MLB collections as sponsored rows.
- Put a collection module above the fold on /pages/nfl and From the Vault, tied to the live sports calendar.
- Track: search single-page share, now 73.7%; /pages/nfl buyer rate, now 0.54%.

Opportunity 7 — Turn one-time buyers into a replenishment habit

What we saw. Repeat behaviour from the order and visit files:

Measure	Value
Orders from returning devices (ret = 1)	15,957 of 55,725 matched orders — 28.6%
Revenue from returning devices	$1,029,660 — 25.7% of window revenue
Returning share of human visits	23.6%, up from 19.5% in the pre-period

Measure	Value
First-purchase devices in the window (ret = 0)	39,768
Welcome flow (Attentive SMS, `2025-x-x-Welcome_1`)	27.3% conversion, $15.97 per visit, $59,464
Welcome flow (email)	24.5% conversion, $15.03 per visit, $33,595

Table 11 — Repeat and flow performance, 15 September – 14 October 2026.

- The repeat buyer is not a segment of this business; a quarter of revenue already arrives on returning devices, and the returning share of traffic rose four points through the window.
- The welcome flow proves the list responds: one visit in four converts, at 22 times the site rate.
- What does not exist yet is the second act: no replenishment or post-purchase flow appears in the campaign data, and 39,768 devices made their first purchase this window.

Why it matters. A replenishment flow touching the window's first-purchase devices at a conservative 5% one-order response is worth up to about $125,000 a month at the window average order, assuming responders buy once at $63.32 and no more. The structural reason: headwear and fan gear are seasonal and team-driven; a buyer in September is a gift and a new-drop buyer by November, but only if the site asks.

Recommended actions.

- Build a post-purchase flow: order confirmation cross-sell at day 3, team-news drop at day 14, replenishment at day 30.
- Segment by league at purchase; a Bears buyer gets the NFC North story, not the generic send.
- Reuse the welcome flow's structure — it already converts at 24–27%.
- Track: ret = 1 share of matched orders, now 28.6%; flow-attributed second orders per month.

Opportunity 8 — Clean the traffic and order record before scaling spend

What we saw.

Measure	Value
Raw visits / dead sessions	4,397,274 / 1,868,538 (42.5%; pre-period 38.8%)
Orders matched to a tracked visit	55,725 of 63,170 — 88.2%
Orders matched to no visit	7,445, worth $395,051
Pipeline bot filter	exclude_confirmed (analysed page datasets)
High-value page reach base	5,513 high-value devices of 3,344,348 visitors

Table 12 — Coverage and match, 15 September – 14 October 2026.

- Two visits in five are dead sessions — one pageview or none, no click, no scroll, no order — and the share rose four points from the pre-period. Human-visit rates in this report are computed after removing them.
- 11.8% of window orders, about $395,000 of revenue, match no tracked visit and sit outside every channel and campaign table above.
- Entry-session counts from the pipeline describe the analysed page and use their own bot filter; they are compared only inside their own tables.

Why it matters. The unmatched $395,051 is revenue no channel table can claim; if it follows the matched mix, roughly $87,000 of it belongs to Meta paid and would move that channel's revenue per visit from $0.72 to about $0.79 — before any creative is paused. The structural reason: tracking coverage and bot filtration are drifting while paid spend scales, and decisions this size deserve a stable tape.

Recommended actions.

- Audit consent and tag coverage on checkout and post-purchase pages; the unmatched orders are where the match breaks.
- Reconcile the dead-session filter against the pipeline's exclude_confirmed filter and record one definition.
- Standardise utm_content naming (words, not numeric IDs) so every creative is auditable.
- Track: order-match rate, now 88.2%; dead-session share, now 42.5%.

Worth watching

Desktop checkout-to-order at 21.3% against 48.3% on mobile. Desktop reaches checkout far more often (75.6% of carts) but converts from checkout less than half as well as mobile. That inversion usually means an instrumentation break or an account-login step on desktop, not buyer behaviour. Verify the checkout_started event on desktop before touching the desktop funnel.

> **Watch out:** the add-to-cart rate fell from 11.22% in the pre-period to 9.57% in the window while conversion held at 2.19% against 2.24%. A sitewide ATC drop with steady conversion can be an event-definition change rather than a behaviour change; confirm the add_to_cart event before reading the fall as real.

From the Vault. 18,315 visits at a 0.35% buyer rate — the weakest collection with volume. If it stays this low after the content-page fix in Opportunity 6, retire it as a landing target.

One weak Google Ads campaign. Campaign 21213618445 spent 66,139 visits at $0.33 per visit while the other Google campaigns hold $2 or better. One row in an otherwise healthy channel — fix the query mix, not the channel.

What's working

We checked these areas closely. Each is healthy and needs no change today.

- **Search as a channel.** 638,950 visits, 3.26% conversion, $2.23 per visit — the site's best engine and the benchmark every paid channel is read against.
- **Google Ads.** $2.16 per visit at 3.2% conversion, accountable campaign by campaign except the one row above.
- **The welcome flows.** 24–27% conversion and $15-plus per visit on both SMS and email; the strongest programme in the bundle.
- **Quick-buy on the first rows.** The first two product-card quick-buy buttons on Fall Collection exposed to 113,850 sessions and returned about $23,665; the pattern deserves the wider use Opportunity 5 asks for.
- **Rage clicks.** Under one rage session per thousand clicking sessions on the analysed page in every week — no frustration signal to fix.
- **Price integrity.** 3.5% of window orders were marked down against the first-half baseline, and the peak days ran below that; the month was not bought with discounts.
- **Returning traffic.** 23.6% of visits and rising, converting the traffic the site already owns into a quarter of revenue.

Suggested next 30 days

Week	Action	Owner
1	Pause the five named-team Meta creatives; re-point to the broad carousels and NCAA/NFL headwear DPA	Paid media
1	Audit the mobile cart drawer against Opportunity 2; ship shipping cost, persistence and express checkout	E-commerce / Dev
2	Refresh the mobile cart-recovery sequence SMS-first; deep-link to express checkout	CRM
2	Re-point Meta product ads from Fall Collection to Sale, Men's Franchise and Headwear	Paid media
3–4	Launch cap-plus-tee bundles on the top team pages; confirm the live shipping threshold first	Merchandising
3–4	Build the browse-abandonment flow on the cart template	CRM
3–4	Fix the top 50 zero-result searches; add collection	E-commerce

Week	Action	Owner
	modules to /pages/nfl and From the Vault	
4	Reconcile order matching and the dead-session filter; standardise utm_content naming	E-commerce / Dev
4	Launch the post-purchase replenishment flow segmented by league	CRM

Table 13 — The 30-day plan. Each action names its opportunity above.

Method and caveats

Window. Orders 15 September – 14 October 2026 (63,170 orders, $4,000,227.39); context period 1–14 September. Visits cover 1 September – 14 October. Weekly tables start Monday; the first and last weeks are partial and labelled. The last day of the report window is 14 October 2026.

Traffic rule. Human visits exclude dead sessions — one pageview or none, no click, no scroll and no order. A visit with an add to cart, a checkout or an order is never excluded. 1,868,538 dead sessions (42.5% of raw visits) were removed from visit-level tables; page tables keep them.

Orders and channels. Channel is last touch: the visit is credited to the link it arrived on. 55,725 of 63,170 window orders matched a non-dead tracked visit; 7,445 orders ($395,051) matched none and are excluded from channel tables. Revenue per visit is on-site value; ad spend is not in the bundle, so profitability checks are framed for Ads Manager.

Devices and identity. Buyers are counted by device id. The 30-day history flag cannot measure repeat rate here: 54,749 of 55,284 buyer visits read as bought_before, so the returning flag (`ret`) is used instead.

High value and thresholds. High value is order revenue at or above $110, the window's 90th percentile rounded to the nearest 10 (6,020 orders, $973,166.69). No shipping or gift threshold appears in the bundle; the free-shipping offer was read from Meta creative copy on 15 October and its minimum, if any, is unconfirmed.

Datasets. Files 07–09 describe the analysed page, Fall Collection (`/collections/fall-collection`), under the pipeline bot filter (exclude_confirmed), and their entry-session counts do not reconcile with site-wide human visits; they are compared only within their own tables. The order-value histogram in the pipeline extract is partial (300 orders on the analysed page), so order-value figures come from the order file.

Peak days. 19 September, 20 September and 4 October are the three highest-revenue days in the window. No promotion calendar exists in the bundle; marked-down share on the peak days (1.5%) ran below the window (3.5%), so the peaks are read as game-calendar demand.

Sizes. Every monthly dollar figure is an estimate from this window's volumes, an upper bound, not a forecast; each states the behaviour it assumes.
